## [5] "bedrooms"        "postalcode"      "garage_included"
```

Elimino pisos que cuesten 0, tengan 0 habitaciones,esten repetidos o sean NA. Tambien para acotar el dataset vamos a coger solo los anuncios de 10 postalcode

```
predata2 = subset(predata1, price>0 & bedrooms>1 & postalcode>=28001 & postalcode<=28011)
predata2 <- na.omit(predata2)
predata <- unique(predata2)
```

Convertir las columnas de valores char("True","False") en num(1,0).Tambien estandarizo todo en numeric

```
predata$terrace <- as.numeric(as.logical(predata$terrace))
predata$garage_included <- as.numeric(as.logical(predata$garage_included))
predata$postalcode <- as.numeric(as.integer(predata$postalcode))
predata$price <- as.numeric(as.integer(predata$price))
predata$floor_built <- as.numeric(as.integer(predata$floor_built))
predata$bathrooms <- as.numeric(as.integer(predata$bathrooms))
predata$bedrooms <- as.numeric(as.integer(predata$bedrooms))
```

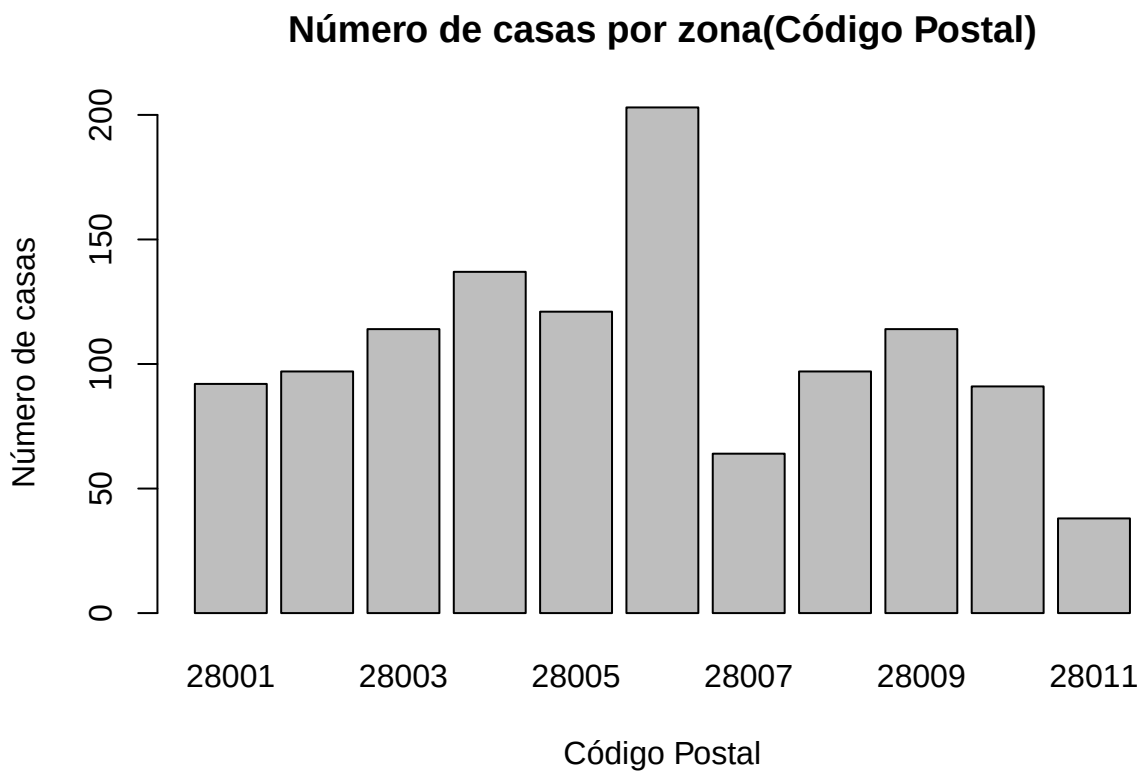
Finalmente despues del preprocesamiento de datos, obtenemos el dataset final

```
data<-predata
```

Una vez con los datos bien definido, pasamos a la visualización.

Primero vamos a ver el número de casas por código postal.

```
barplot(table(data$postalcode),
main="Número de casas por zona(Código Postal)",
xlab="Código Postal",
ylab="Número de casas",)
```



Vamos a etiquetar y categorizar según los metros construidos.

```
data_metros <- data

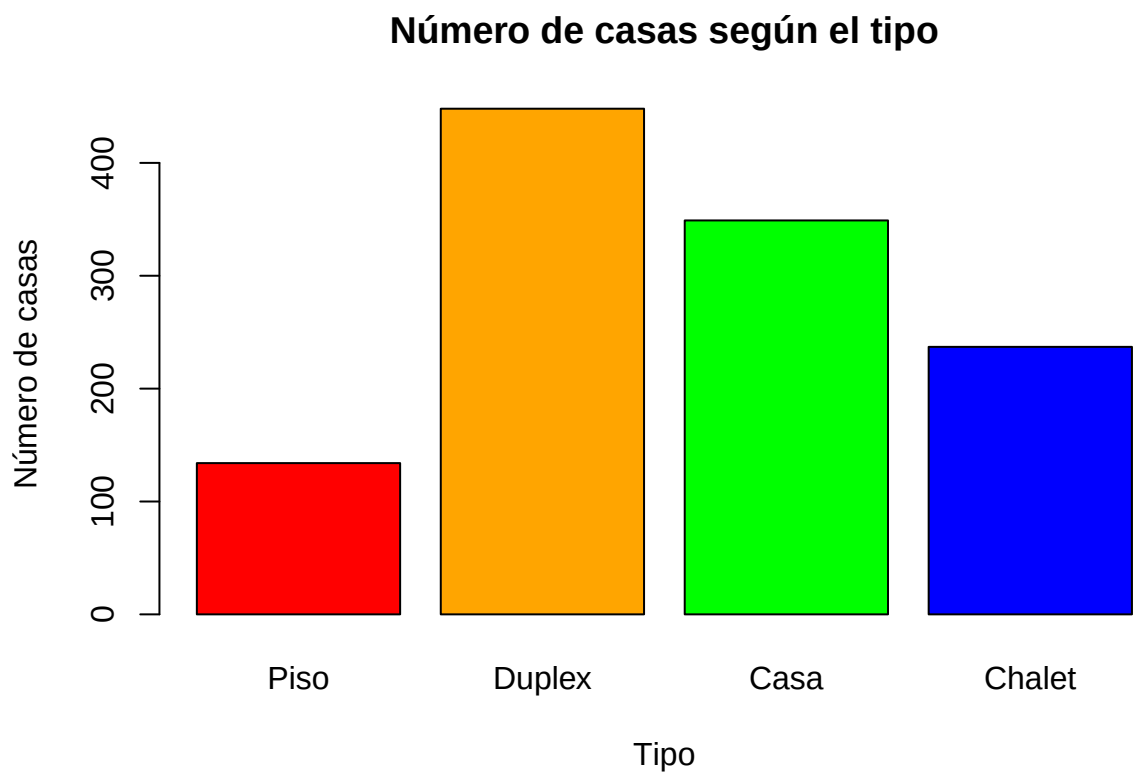
head(data_metros[order(data_metros$floor_built),])
```

```
##      price floor_built bathrooms terrace bedrooms postalcode garage_included
## 7018  1750          30         1       0        2      28009                0
## 2497   800          35         1       0        2      28005                0
## 1376  1990          40         1       0        2      28009                0
## 1537   850          40         1       0        2      28009                0
## 1550   750          40         1       0        2      28009                0
## 1627   950          40         1       0        2      28010                0
```

```
rangos <- c(0,65,100,150,Inf)
values <- c ('Piso','Duplex','Casa','Chalet')

data_metros$tipo <- cut(data_metros$floor_built, breaks = rangos, labels = values)

barplot(table(data_metros$tipo),
main="Número de casas según el tipo",
xlab="Tipo",
ylab="Número de casas",
col=c("red","orange","green","blue"),)
```



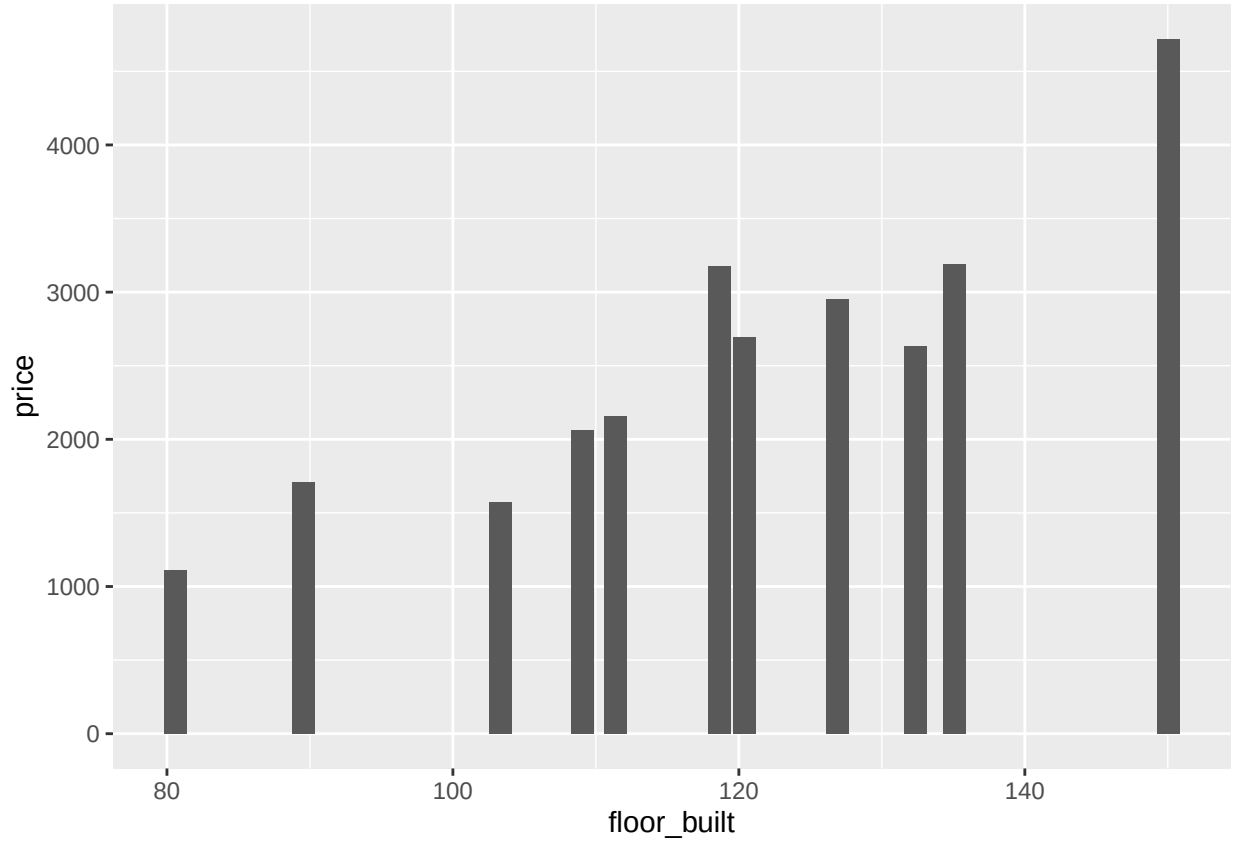
Vamos a calcular el precio medio y metros construidos dependiendo de la zona donde vivas (Código postal)

```
media1 <- aggregate(data[, 1:2], list(data$postalcode), mean)
media1
```

```
##    Group.1    price floor_built
## 1    28001 4720.315   150.02174
## 2    28002 2155.979   111.34021
## 3    28003 2632.711   132.33333
## 4    28004 3177.555   118.61314
## 5    28005 1710.264    89.57025
## 6    28006 3186.567   135.08867
## 7    28007 1570.141   103.35938
## 8    28008 2063.856   109.04124
## 9    28009 2694.211   120.39474
## 10   28010 2953.846   126.87912
## 11   28011 1108.816    80.57895
```

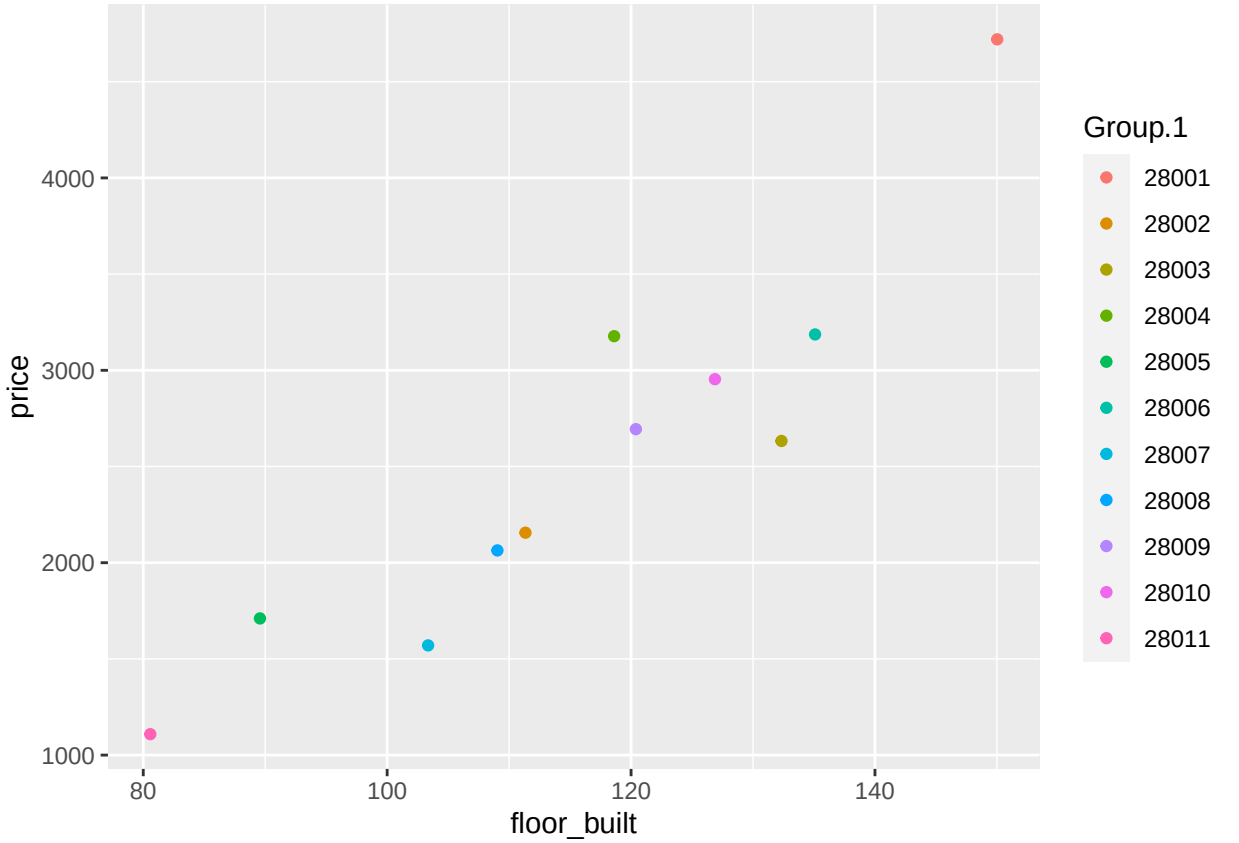
Vamos a graficar la media de precio según los metros construidos de media en en barras

```
ggplot(media1, aes(x = floor_built, y = price)) +
        geom_col()
```



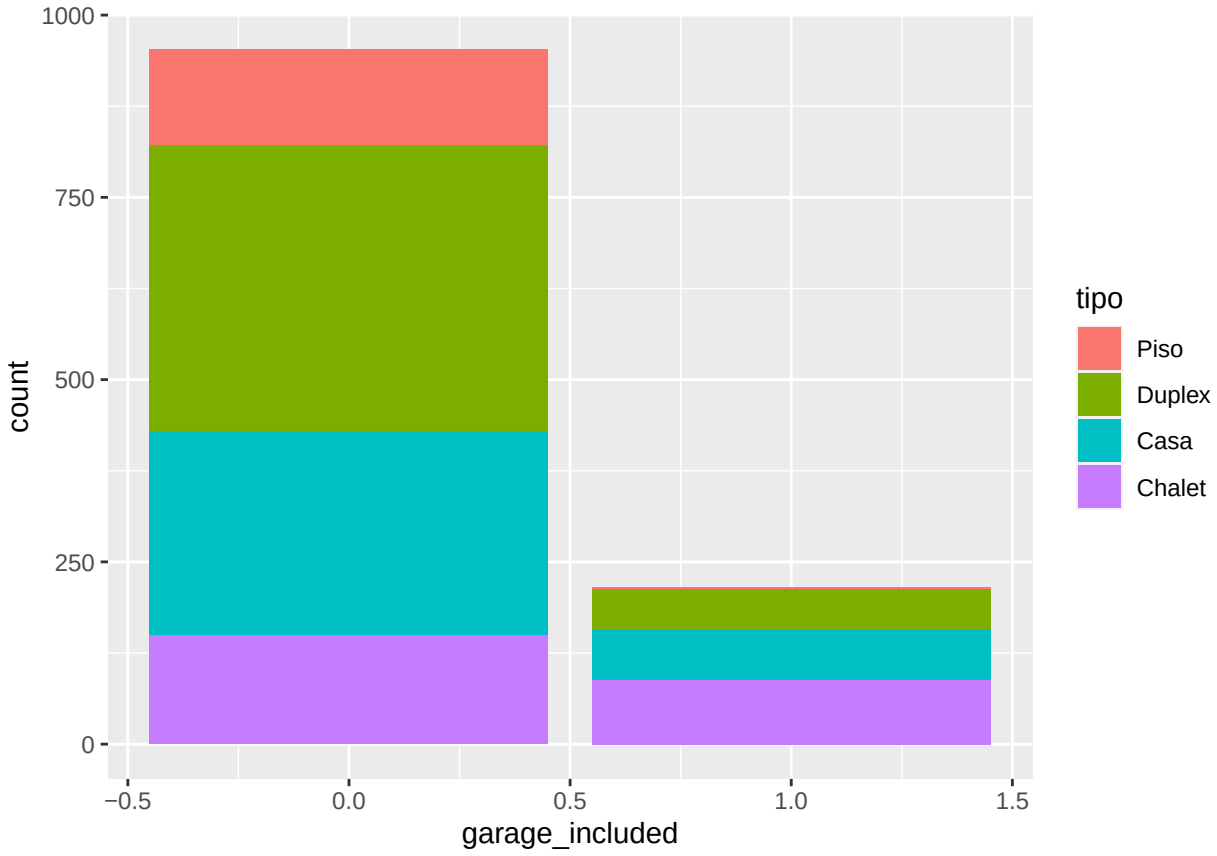
Vamos a graficar la media de precio según los metros construidos de media por zonas en puntos

```
#Pasamos a factor el codigo postal para ver mejor el codigo de colores
media1$Group.1 <- as.factor(as.numeric(media1$Group.1))
ggplot(media1, aes(x= floor_built, y=price, colour=Group.1)) + geom_point()
```



Gráfica para saber dependiendo del tipo de casas si lleva garage o no. Podriamos hacer esto con las diferentes variables, solo habría que cambiar el valor del aes.

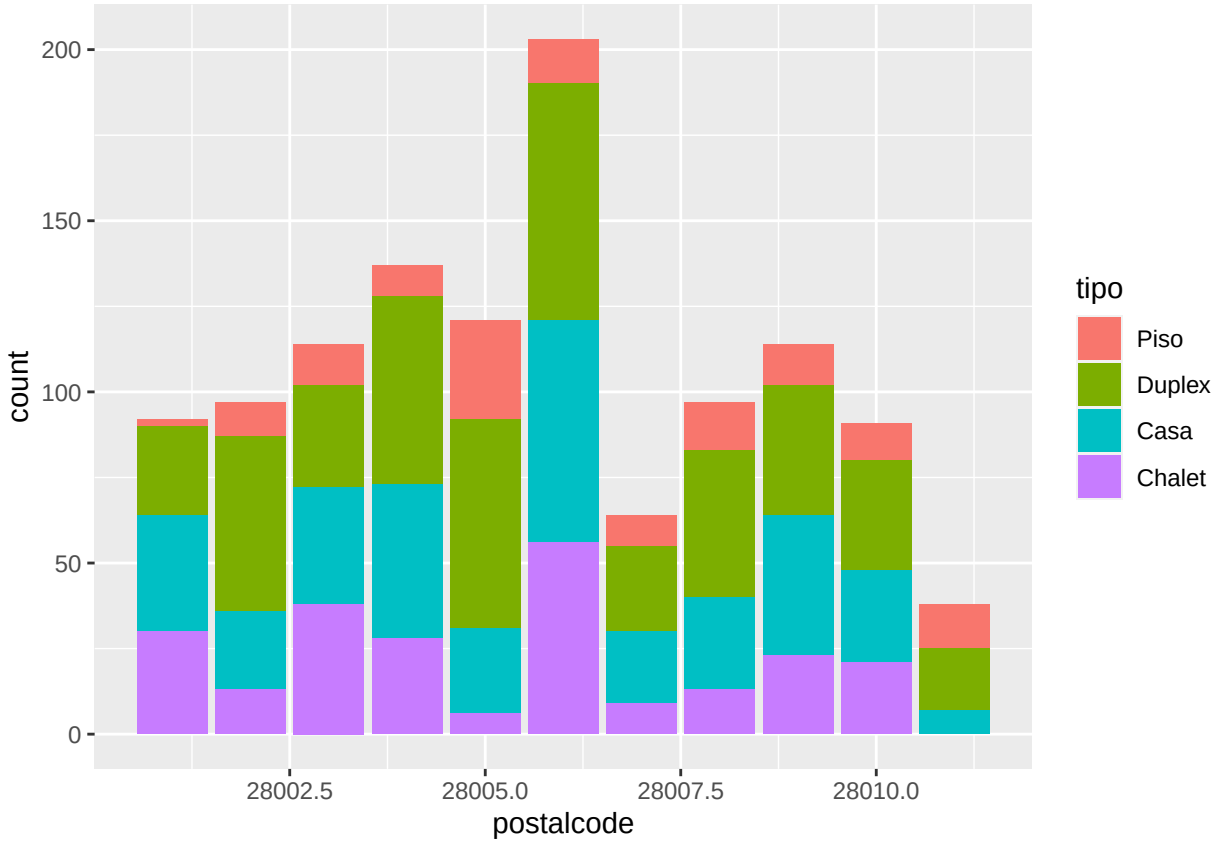
```
a<- ggplot(data_metros, aes(garage_included))
a + geom_bar(aes(fill = tipo))
```



Gráfica según el número de tipos de casas por zona

```
a<- ggplot(data_metros, aes(postalcode))

a + geom_bar(aes(fill = tipo))
```



Ahora vamos a realizar un arbol de decision sobre la variable precio.

Primero partimos el dataset para tener datos de entrenamiento y datos de validacion.

```
train <-createDataPartition(data$price, p = 0.7, list=FALSE)
data_train <- data[train,]
data_val <- data[-train,]
nrow(data_train)
```

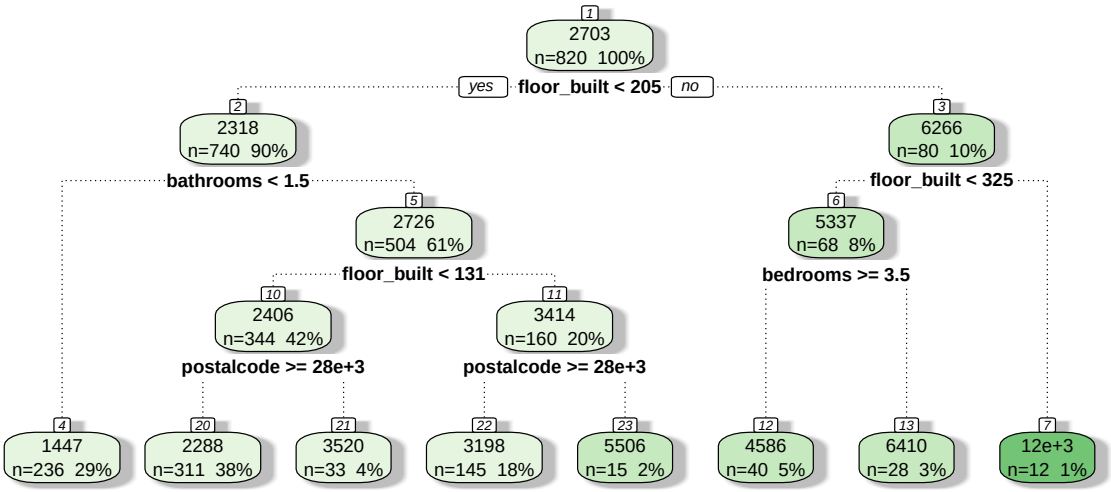
```
## [1] 820
```

```
nrow(data_val)
```

```
## [1] 348
```

Podemos ver las diferentes variables que afectan a su precio y en que nos podemos basar para aproximar el precio medio de una vivienda.

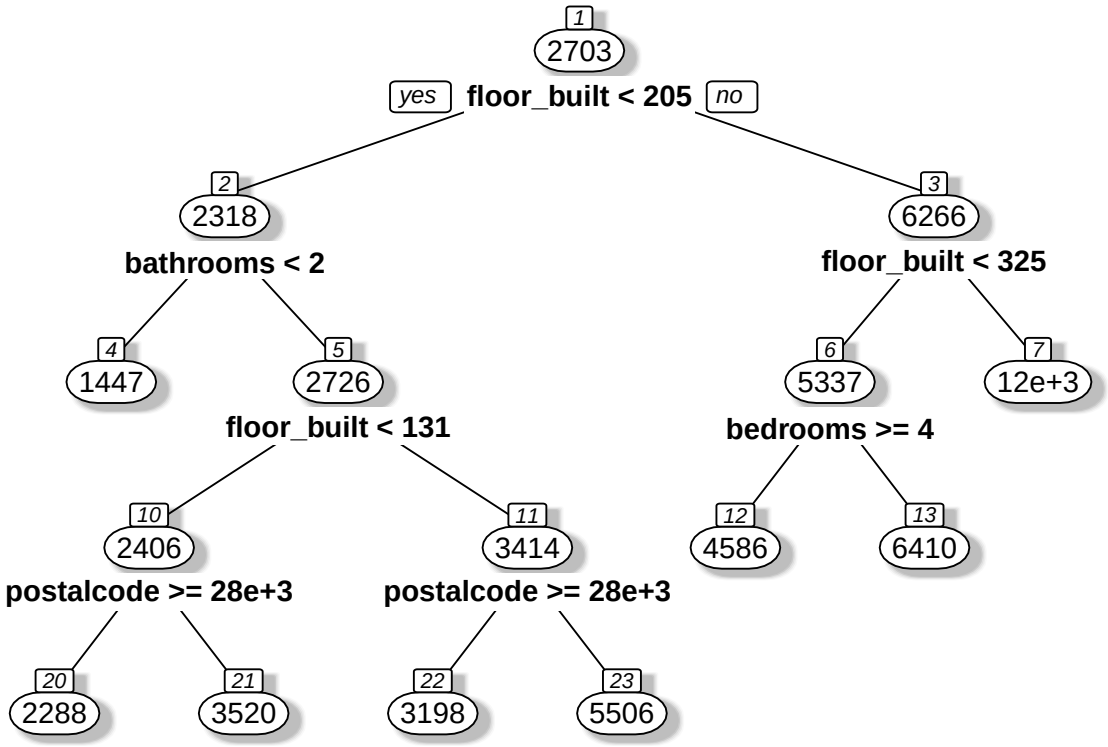
```
arbol <- rpart(formula =  price  ~ ., data = data_train)
fancyRpartPlot(arbol)
```



Rattle 2023−ene.−08 13:15:28 josed

Hacemos un par de cambios en la visualizacion para verlo mejor.

```
prp(arbol, type = 2, nn = TRUE,
    fallen.leaves = FALSE,
    varlen = 0,  shadow.col = "gray")
```

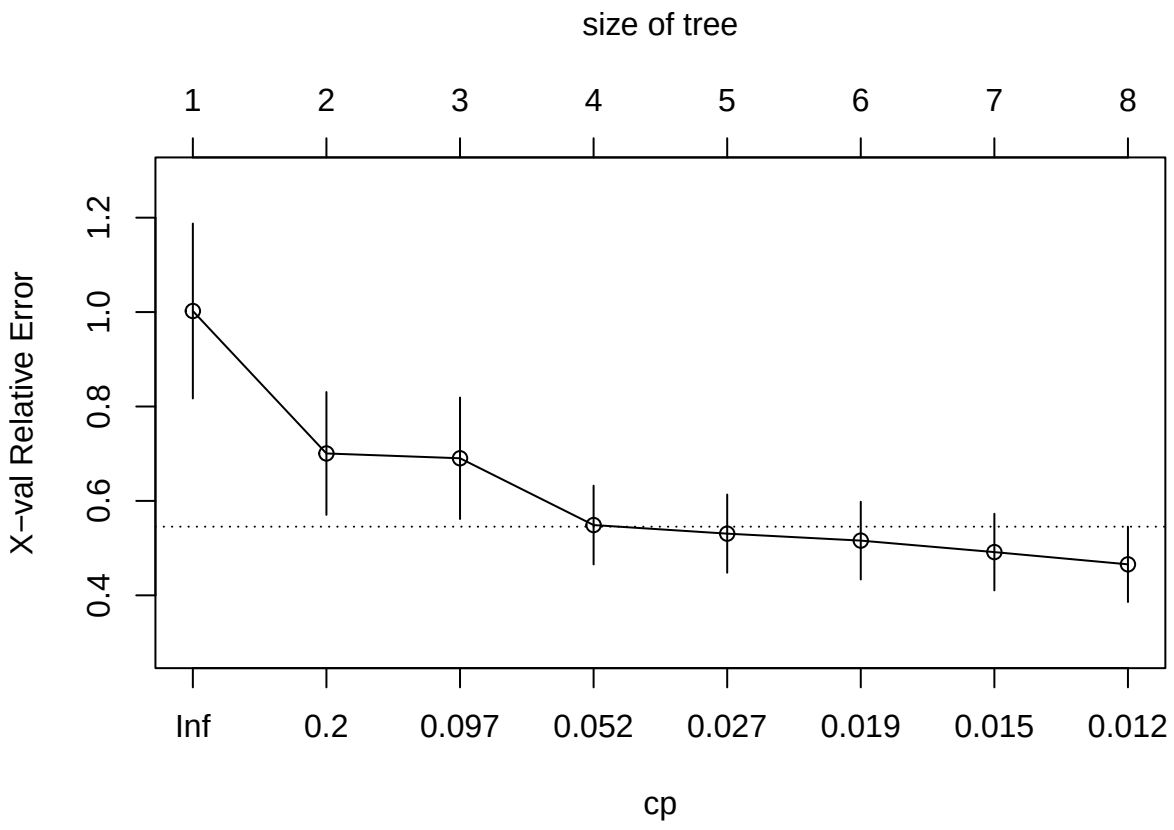


Vamos a ver el error relativo

```
arbol$cptable
```

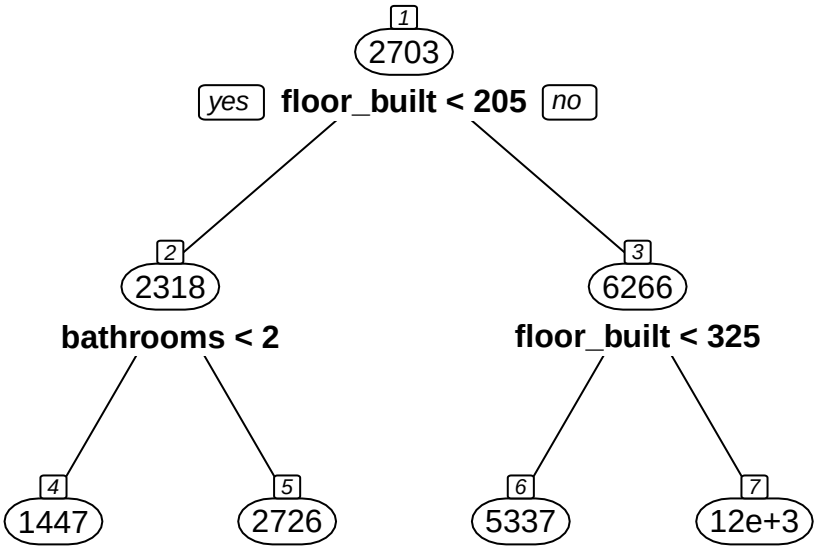
```
##           CP nsplit rel error    xerror       xstd
## 1 0.33989326      0 1.0000000 1.0022770 0.18525854
## 2 0.11816270      1 0.6601067 0.7004840 0.13010449
## 3 0.07949750      2 0.5419440 0.6903374 0.12867676
## 4 0.03355712      3 0.4624465 0.5488270 0.08345104
## 5 0.02186820      4 0.4288894 0.5306323 0.08282386
## 6 0.01656338      5 0.4070212 0.5159217 0.08234627
## 7 0.01369404      6 0.3904578 0.4915559 0.08114578
## 8 0.01000000      7 0.3767638 0.4655977 0.07982682
```

```
plotcp(arbol)
```



Podamos el arból para reducirlo

```
arbol_podado <- prune(arbol, cp = 0.052)
prp(arbol_podado, type = 2, nn = TRUE,
    fallen.leaves = FALSE,
    varlen = 0)
```



Predecimos en el data de validacion y vemos que nos arroja los datos correctos

```
precio_pred <- predict(arbol, newdata = data_val)

precio_pred[1]
```

```
##       17
## 1446.576
```

Vamos a hacer predicciones con datos nuevo del precio según el arbol, para ello vamos a crear valores de pruebas.

```
price <- c(0,0,0,0,0)
floor_built<- c(134,134,234,123,100)
bathrooms<- c(1,3,1,2,3)
terrace<- c(0,0,1,0,0)
bedrooms<- c(2,2,4,2,2)
postalcode<- c(28002,28002,28003,28003,28008)
garage_included<- c(1,1,0,0,1)

data_test_nuevo <- data.frame(price,floor_built,bathrooms,terrace,bedrooms,postalcode,garage_included)

#Construimos unos de pruebas y ponemos a 0 la columna del precio.

#Predeccimos el precio segun el arbol
```

```
 nuevo_precio_pred <- predict(arbol, newdata = data_test_nuevo)

nuevo_precio_pred
```

```
##        1        2        3        4        5
## 1446.576 3198.097 4585.525 2287.662 2287.662
```

Ahora pasamos a aplicar un metodo de regresion multiple para calcular el precio en funcion de las demas variables

```
regresion_mul <- lm(formula = price ~ ., data = data)

summary(regresion_mul)
```

```
##
## Call:
## lm(formula = price ~ ., data = data)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -4805.9  -645.6  -154.4   479.0 13427.9
##
## Coefficients:
##                   Estimate Std. Error t value Pr(>|t|)
## (Intercept)      1.725e+06  3.585e+05   4.813 1.68e-06 ***
## floor_built      2.505e+01  9.188e-01  27.260  < 2e-16 ***
## bathrooms        2.595e+02  4.759e+01   5.453 6.04e-08 ***
## terrace         -2.519e+02  8.177e+01  -3.080  0.00212 **
## bedrooms        -5.412e+02  5.903e+01  -9.169  < 2e-16 ***
## postalcode      -6.159e+01  1.280e+01  -4.812 1.70e-06 ***
## garage_included -2.939e+02  9.770e+01  -3.009  0.00268 **
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 1216 on 1161 degrees of freedom
## Multiple R-squared:  0.604,  Adjusted R-squared:  0.602
## F-statistic: 295.2 on 6 and 1161 DF,  p-value: < 2.2e-16
```

Segun el R^2 el modelo puede explicar en un 60% la variabilidad del precio, ya que R^2=0,604. Tambien vemos que alguna variable predictor está relacionada con el precio ya que el p-value es bastante infimo.. No encontramos ninguna variable con un p-value alto por lo que nos indican que todas contribuyen en parte al modelo.

El metodo step, nos arroja que los metros construidos, los cuarto de baños y el codigo postal son las variables que mas correlacion tienen

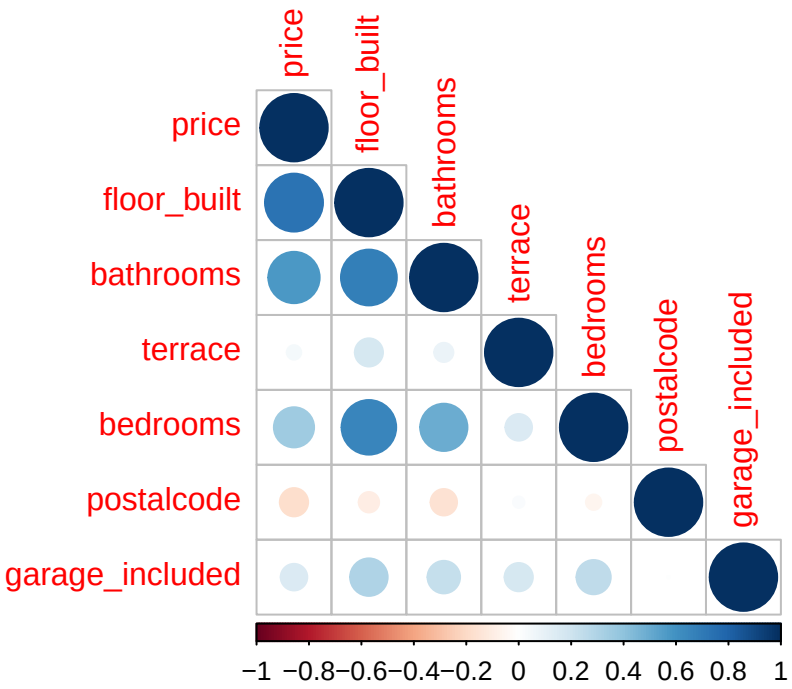
```
step(regresion_mul, direction = "both", trace = 0)
```

```
##
## Call:
## lm(formula = price ~ floor_built + bathrooms + terrace + bedrooms +
```

```
##     postalcode + garage_included, data = data)
##
## Coefficients:
##     (Intercept)      floor_built        bathrooms          terrace
##      1725481.55            25.05           259.54          -251.86
##        bedrooms       postalcode  garage_included
##         -541.23           -61.59          -293.93
```

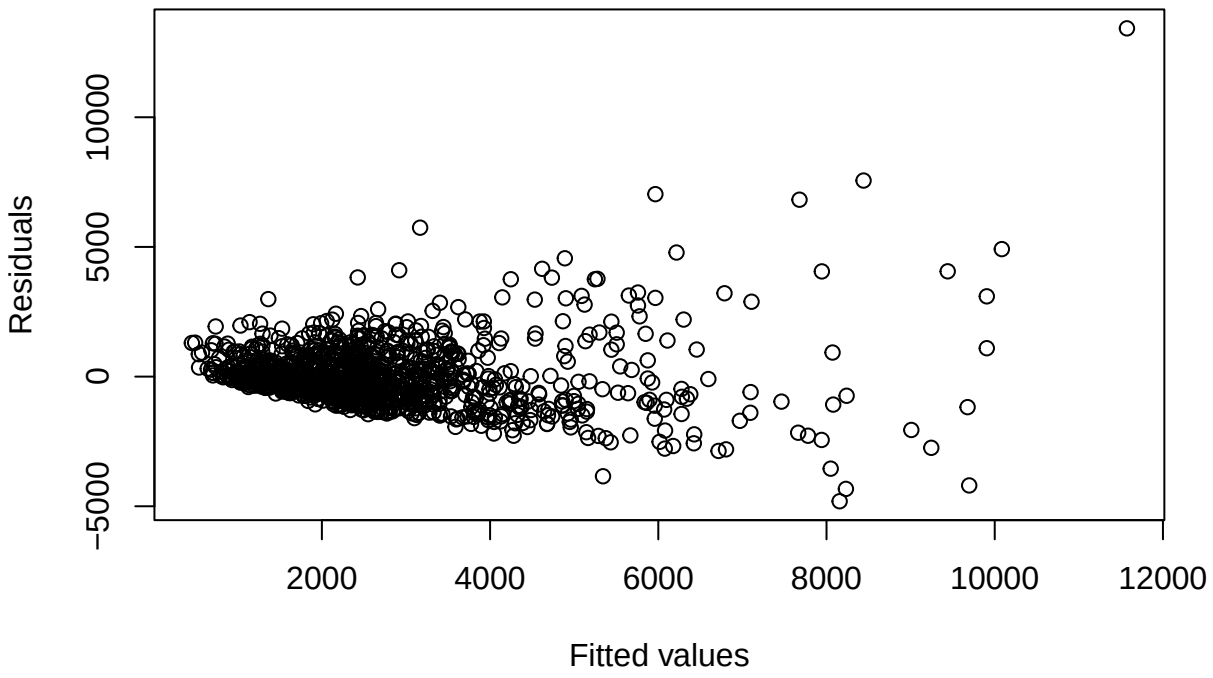
Hacemos un grafico corrplot para ver la correlacion con las variables, donde sacamos que las variables que mas influyen son los metros construidos, los cuarto de baños y el codigo postal. Vemos según diferentes métodos que esas son las variables con mayor correlacion.

```
corrplot(cor(data) ,type = "lower",)
```



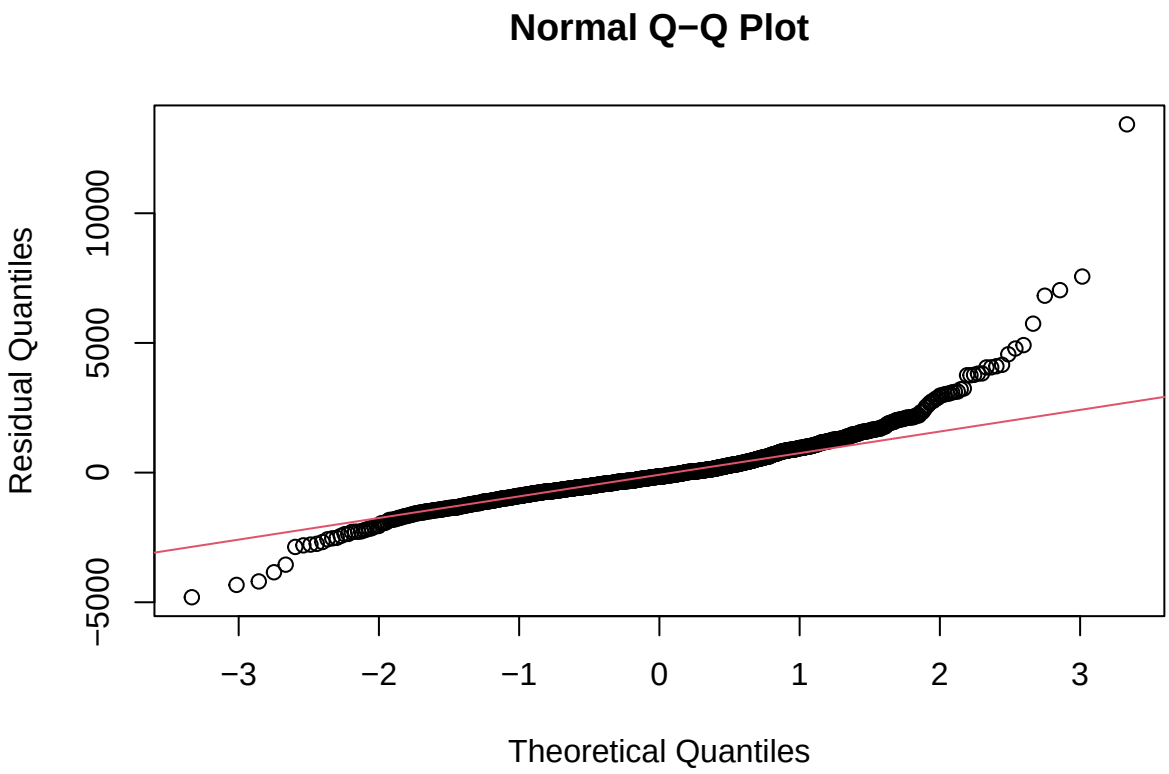
Ahora pasamos a graficar los residuos en funcion de los valores ajustados, es decir distancias entre los estimados y reales.

```
plot(regresion_mul$fitted.values,  regresion_mul$residuals,
     xlab = "Fitted values", ylab = "Residuals")
```



Sacamos el grafico Q-Q para comprar los residuos de dos distribuciones de probabilidad cuando trazamos los cuantiles entre ellos. No apreciamos ningun patron y podemos intuir que esta formanod una linea por lo que concluimos con que el modelo es bueno.

```
qqnorm(regresion_mul$residuals, ylab = "Residual Quantiles")
qqline(regresion_mul$residuals, col = 2)
```



Y vamos a predecir según la regresion multiple, luego compararemos con el arbol de decision

```
predict(regresion_mul,data_test_nuevo)
```

```
##        1        2        3        4        5
## 3195.825 3714.900 4598.534 3412.196 2493.792
```

No supervisado: Clustering con k-means

Primero pasamos a ver que las variables sean numericas

```
lapply(data,class)
```

```
## $price
## [1] "numeric"
##
## $floor_built
## [1] "numeric"
##
## $bathrooms
## [1] "numeric"
##
## $terrace
## [1] "numeric"
##
```

```
## $bedrooms
## [1] "numeric"
##
## $postalcode
## [1] "numeric"
##
## $garage_included
## [1] "numeric"
```

Comprobamos si necesitamos escalarlas.

```
summary(data)
```

```
##      price        floor_built      bathrooms         terrace

```

Una vez lo datos bien estructurados, pasamos a calcular el mejor valor de k. Para ello iremos iterando el valor de 1 a 20 para guardar el valor de compatacion en cada iteracion, luego lo graficaremos y veremos a el k que produce un cambio considerable. Inicializamos la variables nstart a 10 para controlar la aleatoridad.

```r
v_compac <-0

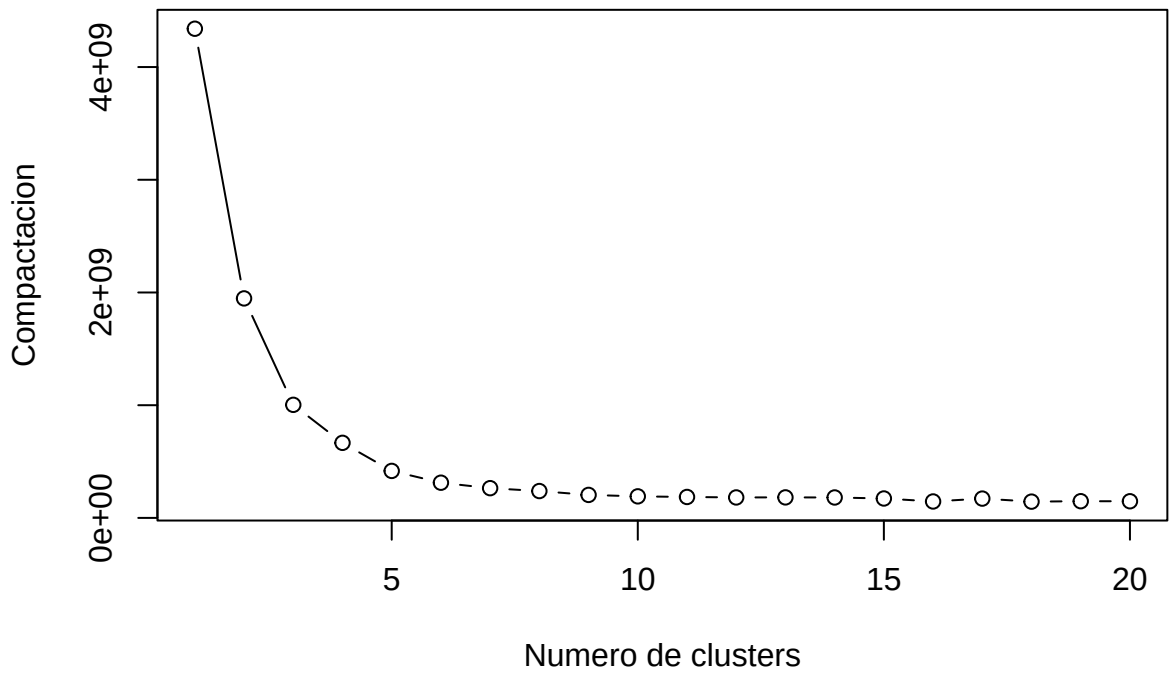
for(i in 1:20){

  km1<-kmeans(data,center=i,nstar=10)
  v_compac[i] <- km1$tot.withinss

}

par(mfrow = c(1,1))

plot(1:20, v_compac, type = "b",
     xlab = "Numero de clusters",
     ylab = "Compactacion")
```



Observamos que en k=3 y k=4 empieza a ver un cambio significativo, por lo cual escogemos estos valorres para K. Pasamos a ver los resultados y comparamos

K=3

```r
kmeans3 <- kmeans(data, center =3,nstart= 10)
kmeans3
```

```

##
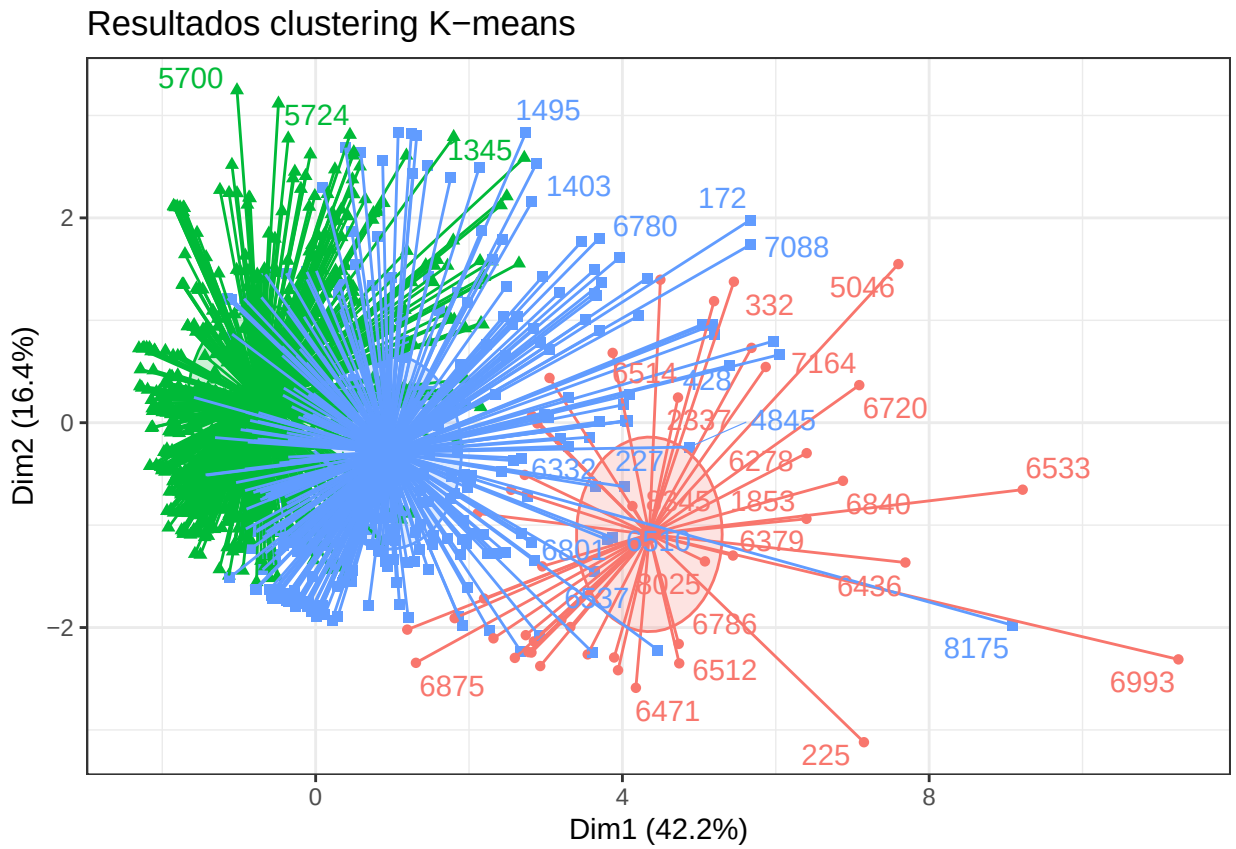
## Within cluster sum of squares by cluster:
## [1] 487898485 211998685 303430117
##  (between_SS / total_SS =  76.9 %)
##
## Available components:
##
## [1] "cluster"      "centers"      "totss"        "withinss"     "tot.withinss"
## [6] "betweenss"    "size"         "iter"         "ifault"
```

Ahora pasamos a graficarlo para ver los resultados

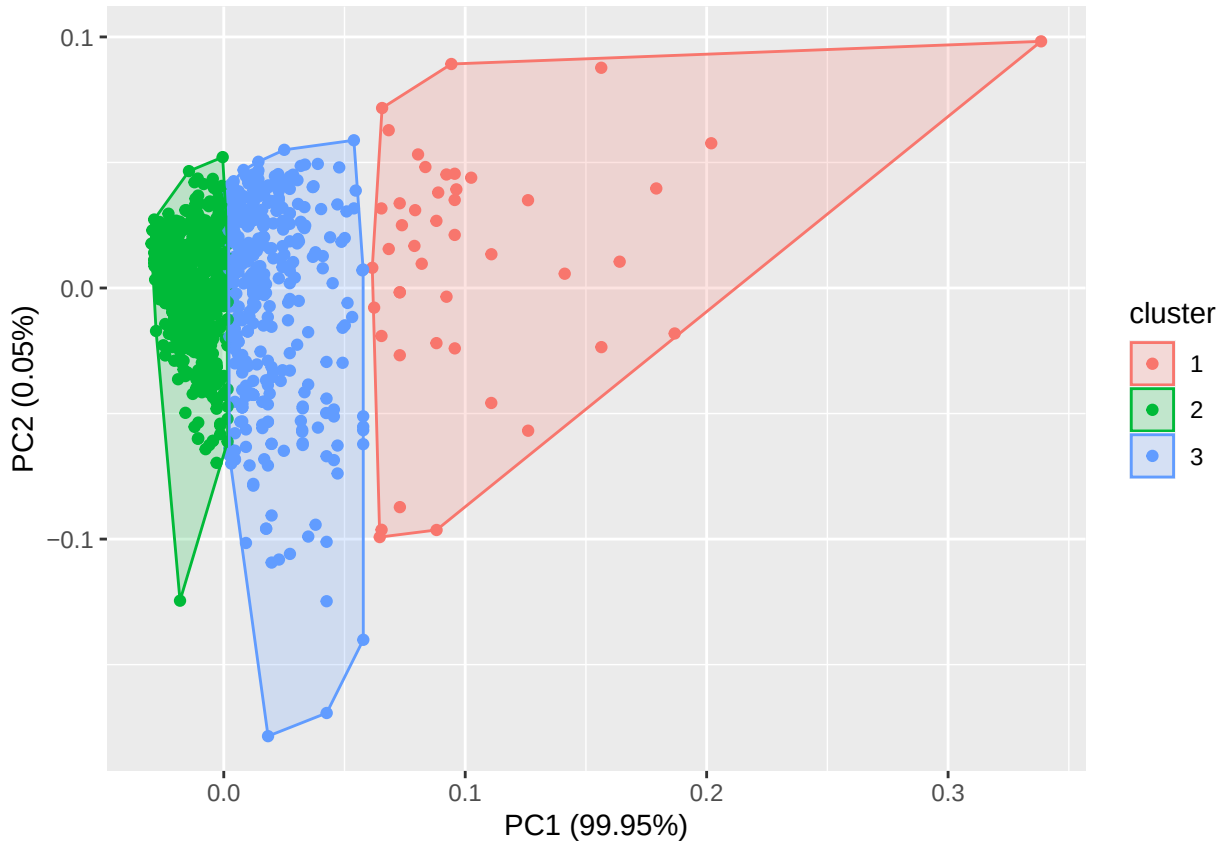
```
fviz_cluster(object = kmeans3, data = data, show.clust.cent = TRUE,
             ellipse.type = "euclid", star.plot = TRUE, repel = TRUE) +
  labs(title = "Resultados clustering K-means") +
  theme_bw() +
  theme(legend.position = "none")
```

```
## Warning: ggrepel: 1132 unlabeled data points (too many overlaps). Consider
## increasing max.overlaps
```



Tenemos muchos valores, por lo que vamos a realizar otro grafico para verlo mas claro.

```
autoplot(kmeans3, data, frame=TRUE)
```



K=4

```
kmeans4 <- kmeans(data, center =4,nstart= 10)
kmeans4
```

```

##
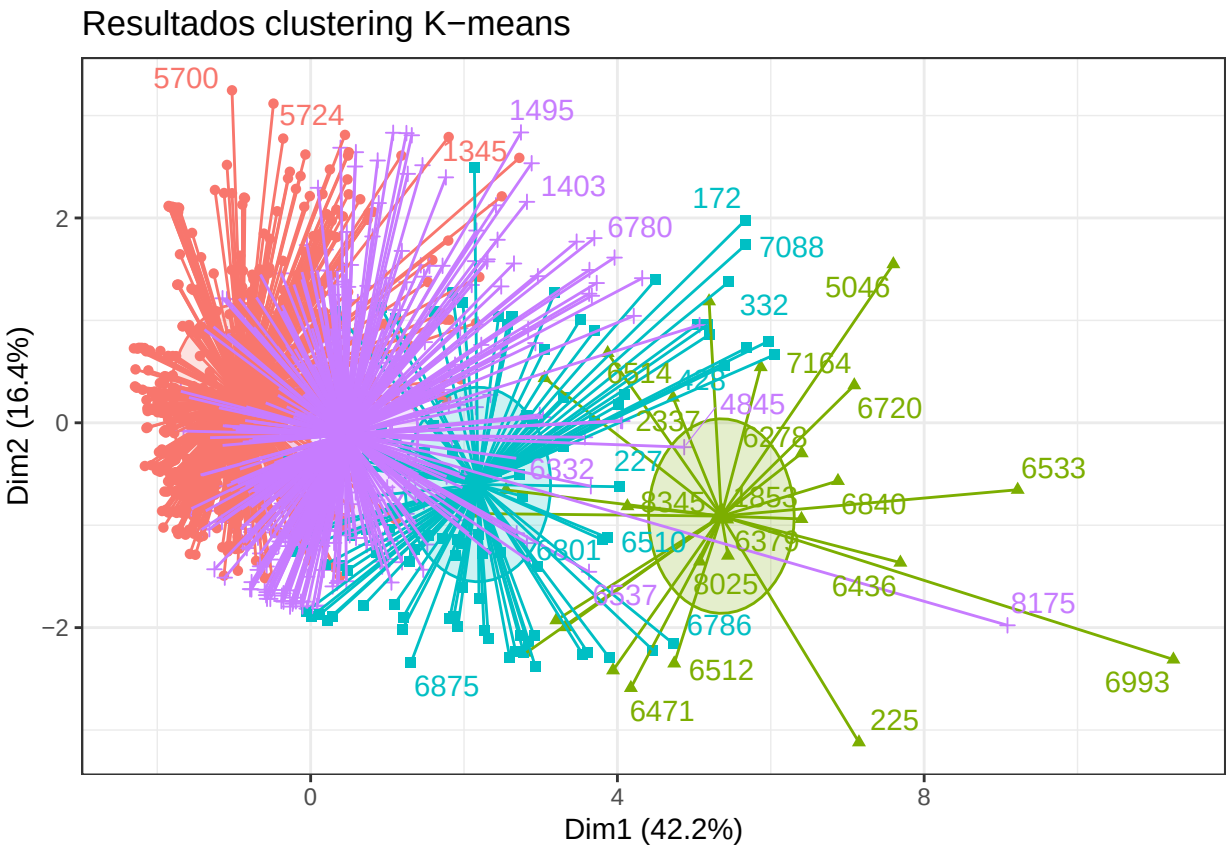
## Within cluster sum of squares by cluster:
## [1]  97929284 327314347 120966510 119938239
##  (between_SS / total_SS =  84.7 %)
##
## Available components:
##
## [1] "cluster"      "centers"      "totss"        "withinss"     "tot.withinss"
## [6] "betweenss"    "size"         "iter"         "ifault"
```

Ahora pasamos a graficarlo para ver los resultados

```
fviz_cluster(object = kmeans4, data = data, show.clust.cent = TRUE,
             ellipse.type = "euclid", star.plot = TRUE, repel = TRUE) +
  labs(title = "Resultados clustering K-means") +
  theme_bw() +
  theme(legend.position = "none")
```

```
## Warning: ggrepel: 1132 unlabeled data points (too many overlaps). Consider
## increasing max.overlaps
```



Tenemos muchos valores, por lo que vamos a realizar otro grafico para verlo mas claro.

```
autoplot(kmeans4, data, frame=TRUE)
```
